Model Based Documentation of Requirements

Week 11 – semester 01

Luc Doumen

Nathalie Fuchs

DE HOGESCHOOL
MET HET NETWERK

Content

- Models & using models
- Topic overview
  - Goal models
  - Use models (system use cases)
  - 3 perspectives on requirements
    - Data/structural: ERM, Class models
    - Functional: Data Flow Diagram, Activity diagram
    - Behavioral: State charts
  - Sequence diagram
- Key learning points
- Questions & answers

Models & using models

Topic Overview

- Goal models

- System use case models (+ descriptions)

- **Three perspectives on requirements**
  - Data perspective
    - ERM, Class models (UML)
  - Functional perspective
    - Data flow diagrams, Activity diagrams (UML)
  - **Behavioral perspective**
    - State charts

- Sequence diagrams

# Behavioral Requirements Models

- For modeling the <u>dynamic behavior of a system</u>

- Focus is on system <u>states</u> and <u>events</u> that can change that state

- Behavioral models

- UML State diagrams
  - Based on principles of finite state machines
  - Modeling elements: state, start- and end states, state transition, concurrency

State Transition Diagram (STD)

UML drawing option 1
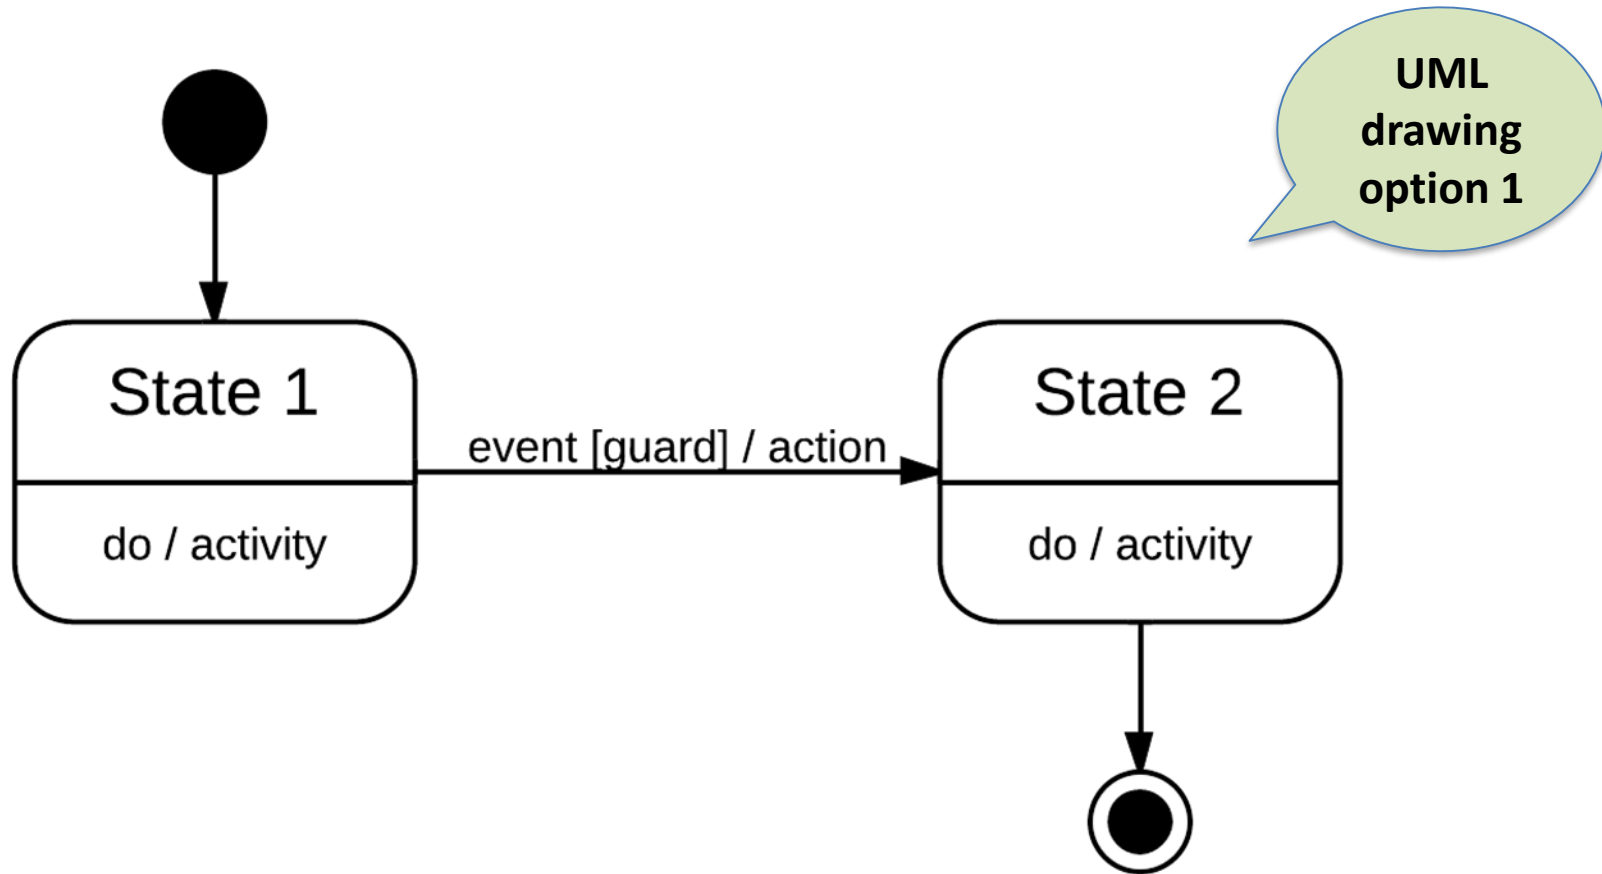

State Transition Diagram (STD) – steps (1)

- Step 1: create or read state transition diagram
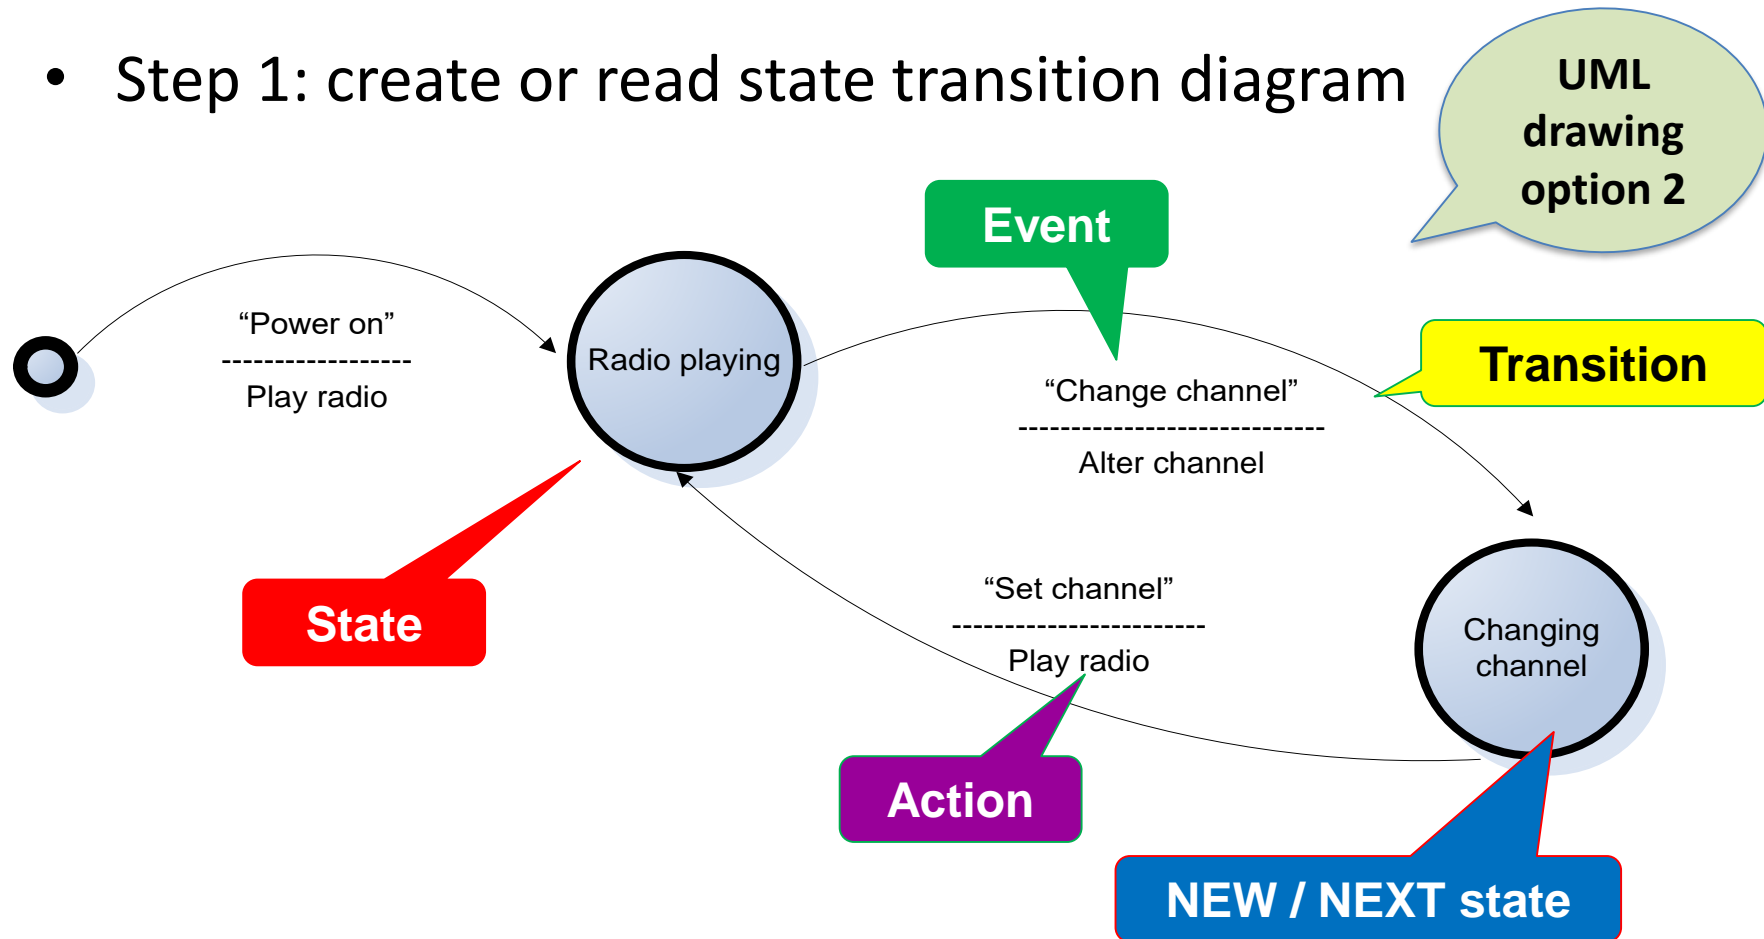

- **Remark**: a transition is only executed when its guard (event) is true

State Transition Diagram (STD) – steps (1)

- Step 2: create state transition table

| EVENT / STATE	Power on	Change channel	Set channel
NULL	**A:** Play radio S_{new}: Radio playing	n.a.	n.a.
Radio playing	n.a.	**A:** Alter channel S_{new}: Channel changing	n.a.
Channel changing	n.a.	n.a.	**A:** Play radio S_{new}: Radio playing

Events

Action

States

NEW / NEXT state

STD – example laptop

STD - how to draw?

- In 5 steps
  - Define states
  - Describe states (for others to understand)
  - Draw transitions
  - Define events / guard conditions
  - Define actions
  - Create state transition table

STD - pro's and cons

- Describes the behaviour of a system
- All possible states a system can get into
- State changes as result of events
- Actions are short effects of transitions

☺ Suitable for modelling interfaces
☺ Suitable for simulation and testing
☹ May be difficult to read for outsiders

STD - Case - Website

- A website has a homepage, by choosing the button contact ' contact information' is provided.

- By choosing the button 'services' an overview is provided of the services.

- The 'services' page also has a hyperlink to the contact information page.

- The home button will bring you back to the homepage.

- Draw the <u>state transition diagram</u>

- Create the <u>state transition table</u>

- You are allowed to ask questions!

STD - Case - Digital pet program

- You're creating a digital pet program. What happens to the pet when he receives different stimuli is determined by the state he's in, so you decide to model the digital pet with a <u>state diagram</u>.

- The behavior of the digital pet program is as follows:

  - When the pet is turned on, it starts out happy

  - If the pet is happy and receives punishment, then he becomes sad

  - If the pet is sad and receives praise, it becomes happy

  - If the pet is sad and receives punishment, it is heart-broken

 - Create also the <u>state transition table</u>

STD - Case - Fuel pump

- Model the behavior of a fuel pump controller
  - User can buy fuel after inserting a credit card, which is read and validated by the controller
  - Then the user takes the hose out of the holster, and pushes the nozzle trigger, to fuel his car
  - When the nozzle is off, the fuel flow is stopped and the price is charged on the credit card
  - If invalid card or timeout the system returns to the initial waiting state

- Draw the <u>state transition diagram</u>
- Create the <u>state transition table</u>

STD - Case - Elevator

- Create the <u>state transition table</u>
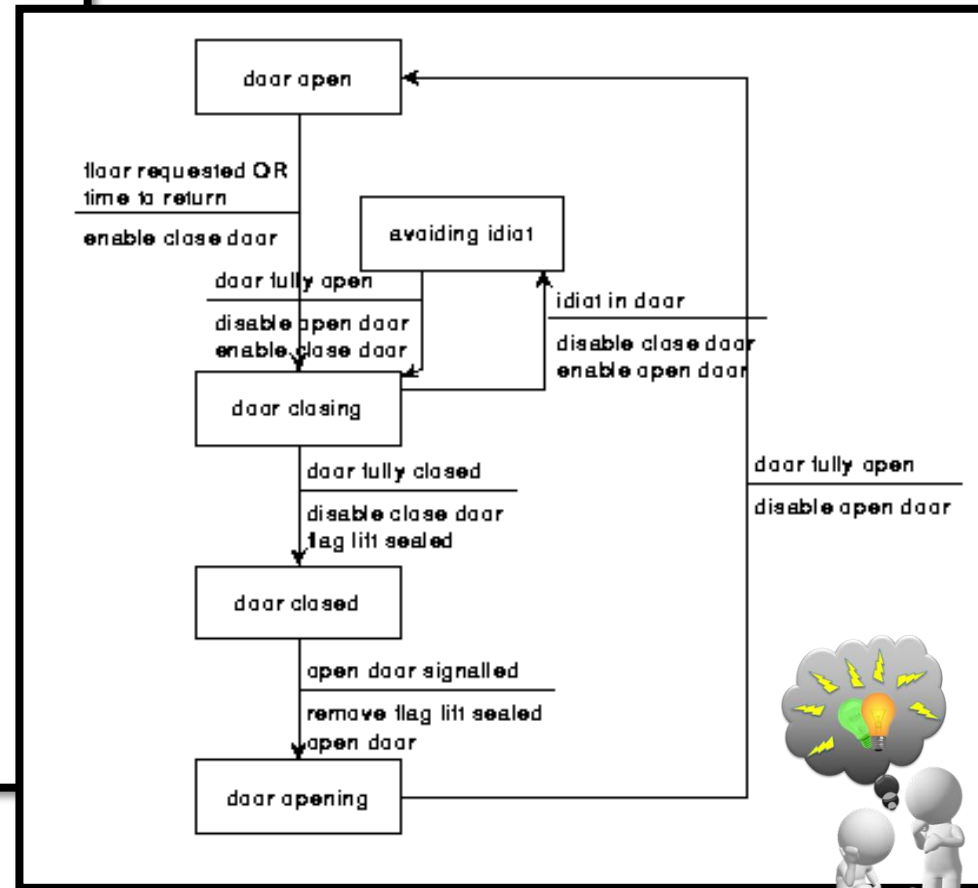

STD - Case - Game

- Create the <u>state transition table</u>
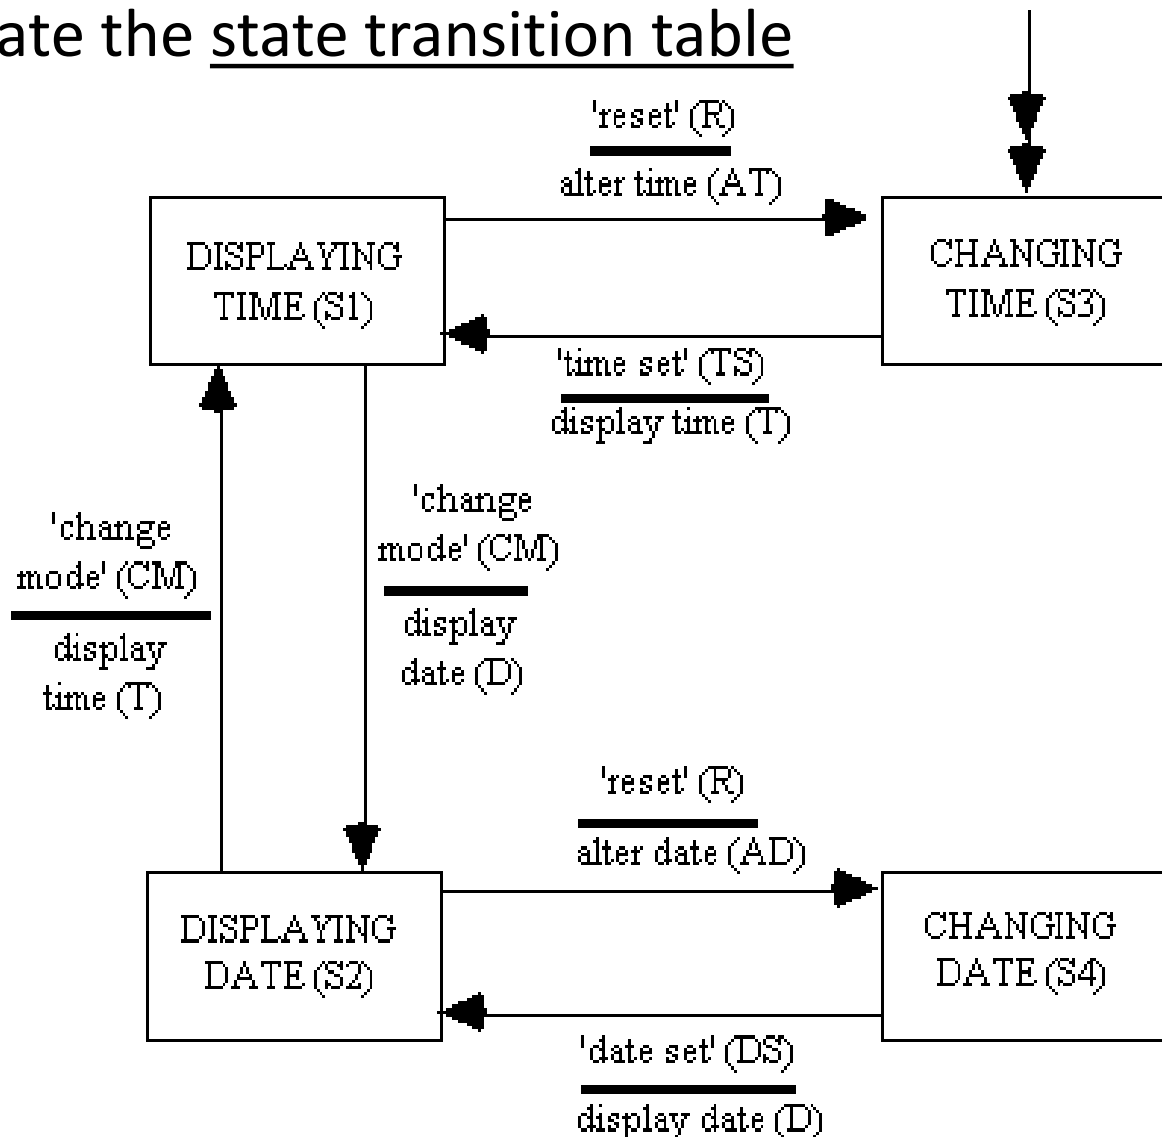

STD - Case - Person's status

- Create the <u>state transition table</u>
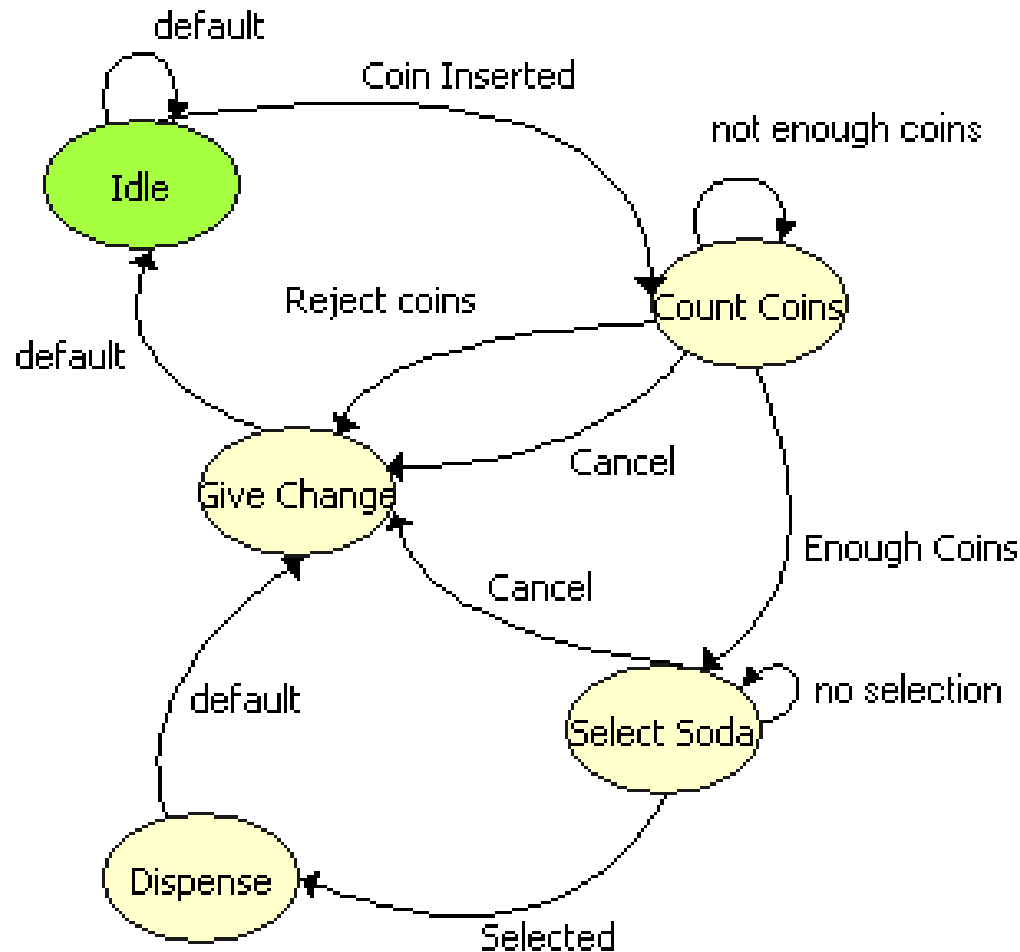

# STD - Case - Clock

- Create the <u>state transition table</u>

STD - Case - Soda vending

- Create the <u>state transition table</u>

STD - Case - Stopwatch

- Create the <u>state transition table</u>

Questions & answers
